

Management of Information Systems

In the modern business world, Enterprise Resource Planning systems (ERP) are a crucial tool in managing some of the world's largest corporations; an active knowledge of these systems is often considered a big advantage on the job market. In this course, students will have an insight into information systems from a business' perspective, and will learn how to implement and manage an ERP system in a small, medium, and large enterprise. During this course, students will also have an opportunity to create and present a plan for ERP implementation in a chosen company. The best assignments will be presented at the Student MIS Conference, which takes place at the Zagreb School of Economics and Management annually. Along with this, students will continually engage in discussions through our distance learning platform – Blackboard.
